

## Math1204 Algebra Handout 2012

A matrix is of size  $m \times n$  if it has  $m$  rows and  $n$  columns.  $C$  is square if it is  $n \times n$ .

Two matrices can only be added or subtracted only if they are of the same size. Two matrices  $A$  and  $B$  can only be multiplied to form  $AB$  if  $A$  is of size  $m \times n$  and  $B$  is  $n \times p$ . In this case  $AB$  will be of size  $m \times p$ . Recall that, in general,  $AB \neq BA$ . The scalar multiple of a matrix  $\alpha \times B$  is formed by multiplying all entries of  $B$  by the real number  $\alpha$ .  $I$  is the identity matrix with zeros everywhere apart from ones on the top left to bottom right diagonal. Only square matrices can have determinants or inverses, although if  $\det(C) = 0$  then  $C$  will not have an inverse, it will be a “singular” matrix.

The following relations are true for any matrices (assuming they can be multiplied/added/inverted):

$(X + Y) = (Y + X)$ $(X + Y) + Z = X + (Y + Z)$ $X(YZ) = (XY)Z$ $X(Y + Z) = (XY) + (XZ)$ $(X + Y)Z = (XZ) + (YZ)$	Additive Commutativity Additive Associativity Multiplicative Associativity Right Distributivity Left Distributivity
$X(X^{-1}) = I$ $(X^{-1})X = I$ $(X^{-1})^{-1} = X$ $(XY)^{-1} = (Y^{-1})(X^{-1})$	Right Inverse Left Inverse Double Inverse Inverse Product
$(XI) = X$ $(IX) = X$ $X^2 = XX$ $(XY)^2 = XYXY$ $(X + Y)^2 = X^2 + XY + YX + Y^2$	Right Identity Left Identity Matrix Square Square Product Square Sum
$(X + Y)^T = (X^T) + (Y^T)$ $(XY)^T = (Y^T)(X^T)$ $(X^T)^T = X$ $(X^T)^{-1} = (X^{-1})^T$	Transpose Sum Transpose Product Double Transpose Transpose Inverse
$(\alpha \times X)Y = \alpha \times (XY)$ $X(\alpha \times Y) = \alpha \times (XY)$ $(\alpha \times X)^T = \alpha \times (X^T)$ $(\alpha \times X)^{-1} = \alpha^{-1} \times (X^{-1})$	Left Scalar Associativity Right Scalar Associativity Scalar Transpose Scalar Inverse
$\det(XY) = \det(X) \det(Y)$ $\det(X^T) = \det(X)$ $\det(X^{-1}) = (\det(X))^{-1}$ $\det(\alpha X) = (\alpha^n) \det(X)$	Determinant Product Determinant Transpose Determinant Inverse Scalar Determinant ( $X$ is $n \times n$ )
